9:00 17:00	【Demonstration】 Experience of Forecasting Systems with a View to Arctic Observation - Introduction of Short- and Mid-term Forecasting Techniques - <i>by Arctic Sea Ice Information Center, National Institute of Polar Research, NIPR</i> As global warming progresses, temperatures are rising significantly, especially in the Arctic region. Consequently, the summer sea ice extent in the Arctic is decreasing, drawing attention to the use of the Arctic Passage. The Arctic Sea Ice Information Center has been providing mid-term and short-term sea ice forecasts, which are useful for navigating the Arctic Passage and observing the Arctic Ocean, to vessels operating in the Arctic and to the oceanographic research vessel "Mirai" to verify their effectiveness. The exhibit will present the latest information on these forecasts and the changes in oceans and sea ice, as well as their impacts. Let's think together about the current state of sea ice forecasting and global warming.
